STATISTICAL BACKGROUND OF THE NRA

by

Victor S. von Szekelski

STATISTICS STUDIES SECTION  
MARCH, 1936

SUMMARY DATA RELATING TO OPERATION OF THE NRA

The statistical exhibits are arranged according to the following classification of objectives and problems.

I.	<u>The Objective of Increased Production, and reem-</u> <u>ployment Through Increased Production . . . . .</u>	<u>Page</u> 1
	"It is hereby declared to be the policy of Congress . . . to promote the fullest possible utilization of the present productive capacities of industries . . . and to reduce and relieve unemployment." . . . . .	1
A.	Data on Production and Employment . . . . .	1
	1. Production records, U.S. and Foreign . . .	1
	2. U.S. industrial Production vs. Capacity .	1
	3. Output of consumers' goods. Monthly index . . . . .	9
	4. Output of capital goods and construction materials. Sources of spending power for this class of goods.	12
	5. Employment and unemployment, number (employed in NRA Industries) . . . . .	20
	6. Employment in manufacturing, railroads and agriculture . . . . .	22
	7. Relief, number and costs . . . . .	24
B.	The Problem of Change.	25
	1. Technological displacement of labor . . .	25 chart p. 28
	2. Industrial migrations . . . . .	31 tables pp. 32-47
	Regional wage differentials . . . . .	
C.	The Problem of Out-of-Balance Prices . . . . .	48
	Demoralized prices, and price disparities, particularly between rigid-prices and flexible prices goods, are said to have contributed to the contraction of business activity.	
	1. Price indexes for most flexible and least flexible prices, and relations between them . . . . .	48 chart p. 54
	2. Price index by commodity groups, and relations between them . . . . .	48 charts pp. 51-57
	3. Prices and other series related to building . . . . .	49 charts pp. 57-79
D.	Economic Behavior . . . . .	80
	1. Interrelation between Production, prices and wages . . . . .	charts pp. 81-84
	2. Price and production in various industries.	charts pp. 84-92

E.	The Problem of Purchasing Power . . . . .	93
	In general, recovery in consumers' goods industries is said to be keyed to the amount of money consumers have available to satisfy their accumulated wants. "It is hereby declared to be the policy of Congress . . . to increase the consumption of industrial and agricultural products by increasing purchasing power." Demand for goods - desire plus purchasing power.	
	1. National income figures, and relation to cost of living; weekly wages, hourly earnings . . . . .	96-106
	2. Cost of living . . . . .	94
	3. The special problem of lower bracket incomes; Low wage industries, low wage regions, sub-average wages . . . . .	95
F.	The Problem of Industrial Concentration and the Small Firms Problem. "Codes shall not permit monopolies or monopolistic practices," or eliminate "or oppress small enterprises." . . . .	107
	1. Profits in large corporations vs. profits in others . . . . .	111
	2. Data on total assets and cash position . . . . .	112-113
	3. Various data classified by size of firm . . . . .	114-119
II.	<u>The Temporary Objective of Work-Sharing.</u> (Reemployment by work-sharing may be distinguished from reemployment by recovery.) " . . . more men to do the existing work by reducing the work-hours of each man's week." . . . . .	120
	A. Man-hours used in manufacturing: Comparisons . . . . .	121
	B. Hours-per-week in manufacturing and principal manufacturing industries . . . . .	122
	C. Hourly earnings and hours worked per week in specified industries . . . . .	122-126
III.	The Objective of Stabilized Output . . . . .	127
	A. The problem of adjustment of supply and demand. (No statistical exhibits)	
	B. The problem of seasonal instability; seasonal indexes of employment and/or payrolls in irregular industries. High peaks and low valleys . . . . .	128-131

	<u>Page</u>
IV. <u>The Objective of Fair Competition.</u> Classifi- cation of trade practice provisions in codes . . . . .	132
V. <u>The Objective of Cooperative Action of Labor and management.</u> (No statistical exhibits)	
VI. <u>The Objective of Conservation</u>	

"It is hereby declared to be the policy of  
Congress . . . to conserve natural resources".  
(No statistical exhibits)

I. THE OBJECTIVE OF INCREASED PRODUCTION, AND REEMPLOYMENT THROUGH INCREASED PRODUCTION

A. PRODUCTION AND USE OF CAPACITY

"It is hereby declared to be the policy of Congress.....to promote the fullest possible utilization of the present productive capacities of industries. . . ."

Table 1 and Chart 1 show the general course of depression and recovery for the United States, and other important countries, by years through 1932 and by months for 1933-35. The depth of depression varied from country to country. Some adjusted themselves to the shocks of deflation and succeeded in maintaining a relatively high rate of activity, while others did not. The problem of recovery presented itself to each with different intensity.

Economic activity in the United States in 1932 and early 1933 had sunk farther relative to pre-depression levels than that of any of these countries, and unemployment was more acute. The recovery problem presented itself with greater insistence here than in most, if not all, other countries.

The drop in the world position of the United States in sixteen commodities is shown in table 2. This compares the ratio of U.S. output to world output in 1929 and 1934. The comparison would have been still more unfavorable in 1933. In two cases the position of the United States showed an increase, but, for most, and the most important, commodities the loss of the United States was severe. The extreme drop was in copper, in which the United States fell from 52% of the world's output in 1929 to 19% in 1934.

Use of Physical Resources. The physical plant of the United States was partly idle even during the '20's. The obvious fact of idle machinery standing ready to produce goods of which millions were in need has caused a number of studies to be made of the producing capacity of the country. The most conservative of these is "America's Capacity to Produce." published by the Brookings Institution. The amount of this unutilized capacity is indicated in Chart 3.

Amount of capacity being used in 29 manufacturing industries in 1925 - 29, and in 23 mineral industries, 1929, are shown in charts 4 and 5. This shows American industry operating at its best; at its worst, in 1932 and early 1933, some industries were down below 15% of capacity. Hence the obvious reasonableness of Congress's objective of "maximum possible utilization of present productive capacity."

INDUSTRIAL PRODUCTION IN SIX COUNTRIES

## CHART 4

## UTILIZATION OF MINERAL CAPACITY. 1929

Most of the mineral industries operated within a range of from 77 to 87 per cent of practical capacity in 1929. The percentage of utilization in various representative divisions is shown in Figure 6. The weighted average was about 83. The divisions which fell furthest below the average were mostly small in size, whereas two large divisions rose to about 95 per cent.

- |   |                               |
|---|-------------------------------|
| 1. Copper refineries, electrolytic            | 12. Anthracite collieries     |
| 2. Byproduct coke plants                      | 13. Clay mines                |
| 3. Iron blast furnaces                        | 14. Lead smelters, Missouri   |
| 4. Copper mines                               | 15. Carbon black plants       |
| 5. Petroleum refineries                       | 16. Zinc mines                |
| 6. Lead mines                                 | 17. Fuel briquet plants       |
| 7. Bituminous coal mines                      | 18. Zinc, electrolytic plants |

## CHART 5

## UTILIZATION OF MANUFACTURING CAPACITY, 1925-29

PERCENTAGE OF CAPACITY UTILIZED

Among manufacturing industries as in the minerals, there was wide variation in the ratio of actual production to practically attainable capacity, averaging roughly around 80 per cent. In this chart some industries supplying a product with a growing demand, such as full-fashioned hosiery, are shown to have operated in 1929 well above that level, but others could have more than doubled their output if they had been able to sell the enlarged product. Thus, the locomotive industry was operating at a bare 40 per cent. Such important industries as automobiles, cotton manufactures, and shoes were around 80 per cent although if the consumptive needs of the people could have been translated into purchasing power the market demand would have exceeded capacity. In surveying manufacturing capacity, as in other divisions of production, full allowance was made for practical factors of operation.

- |                                 |                                  |
|---------------------------------|----------------------------------|
| 1. Full-fashioned hosiery       | 15. High explosives              |
| 2. Dairy products               | 16. Men's clothing               |
| 3. Steel                        | 17. Chlorine and allied products |
| 4. Paper                        | 18. Wire                         |
| 5. Printing and publishing      | 19. Rolled (steel) products      |
| 6. Meat packing                 | 20. Lumber                       |
| 7. Silk and rayon manufactures  | 21. Machine tool                 |
| 8. Automobile tire              | 22. Beer sugar                   |
| 9. Pig iron                     | 23. Wood manufactures            |
| 10. Window glass                | 24. Tin plate                    |
| 11. Automobile                  | 25. Window glass                 |
| 12. Fruit and vegetable canning | 26. Textile machinery            |
| 13. Cotton manufactures         | 27. Black powder                 |

|                                 | 29. Locomotive                   |

REPRODUCED FROM "THE TROUBLE WITH CAPITALISM IS THE CAPITALISTS,"  
FORTUNE, NOVEMBER 1935, BY PERMISSION OF DR. HAROLD G. MOULTON.

OUTPUT OF CONSUMERS' GOODS

The output of consumers' goods is, in the last analysis, what the population lives on, and what determines a country's standard of living. General production indexes, heavily weighted as they are with construction materials and semi-finished materials destined for capital goods, will not measure what is made for direct consumption.

Chart 6 - presents a monthly index of consumer's goods production adjusted for population growth (as the population has increased about 12% since the 1923-25 period used as base, 100 today no longer means what it meant in 1923-25. The "normal" is no longer 100, but about 112).

The per capita supply receded below 75% (of 1923-25 = 100) in 1932 and early in 1933. This was including passenger automobiles. The supply of goods other than automobiles receded below 80%.

This contraction occurred in spite of a capacity more than ample to continue turning out consumers' goods at the 1929 rate.

The money spent for consumers' goods originates (mostly) in pay-rolls, salaries, and farm and other entrepreneurial income, and to a lesser extent in dividends and interest received by individuals.

Another, and more comprehensive index, on an annual basis, is that the National Bureau of Economic Research, reproduced herewith.

OUTPUT OF CONSUMPTION GOODS, 1929-1934

	Manufactured Consumption Goods					Non-Manufactured <sup>1</sup> Consumption Goods	Total
	Foods	Clothing	Automotive Products	Other	Total		
1929	100	100	100	100	100	100	100
1930	98	87	71	90	88	105	91
1931	92	89	59	74	81	107	86
1932	82	81	45	58	69	103	75
1933	84	93	52	66	76	102	81
1934	86	88	62	70	78	104	83
Change as a percentage of 1929							
1929-32	-18	-19	-55	-42	-31	+ 3	-25
1932-33	+ 2	+12	+ 7	+ 8	+ 7	- 1	+ 6
1933-34	+ 2	- 5	+10	+ 4	+ 2	+ 2	+ 2

Source: Bulletin 58, November 15, 1935. National Bureau of Economic Research.

<sup>1</sup>The classification of non-manufactured consumption goods includes all or a part of the following: fruits, vegetables and truck crops; milk; poultry products; fresh fish; anthracite coal; natural gas; electricity.

This is divided into groups. Clothing output fell from 100 in 1929 to 81 in 1932. Foods fell almost as much. Non-manufactured goods (mostly farm produce, and including anthracite coal and electricity) increased from 100 to 103. This reflects the partial switch from processed to plain foods because of decreased income. Automobile products, being durable, and their purchase being postponable, fell off most.

There is another important consumers' good that might be included with as much justification as passenger automobile production, namely residential building. This practically ceased at the bottom of the depression. Of course, in the case of consumers' durable goods such as automobiles and residences, what the consumer consumes is transportation and shelter from the accumulated stock of such goods. The country's stock of motor vehicles declined from about 23,600,000 as the end of 1929 to 22,177,000 at the end of 1932, or 6%, while the output of automobile products was down 45%.

Consumer Inventory of Motor Vehicles

	<u>Motor Ve-</u> <u>hicles in use</u> <u>end of year</u>	<u>Population</u>	<u>Motor Ve-</u> <u>hicles per</u> <u>1000 persons</u>
1928	22,122,000	120,690,000	184
1929	23,601,000	122,358,000	193
1930	23,771,000	123,630,000	192
1931	23,078,000	124,446,000	185
1932	22,177,000	124,256,000	177
1933	20,710,000	126,088,000	164

Calculated from registration figures published by the U.S. Bureau of Public Roads. Motor vehicles in use end of 1928 equals all vehicles registered during 1929 less new vehicles sold and registered during 1929, plus government vehicles not registered. NACC "Facts and Figures".

While the supply of essential consumers' goods per head was not seriously contracted, the distribution became worse as the depression deepened. Many may have consumed as much or more of the essentials of those still employed in 1932 as in 1929, but the unemployed could fill only a portion of their usual wants.

# PRODUCTION OF CONSUMER'S GOODS PER CAPITA BY MONTHS 1923-1935

## CAPITAL EQUIPMENT AND CONSTRUCTION MATERIALS

Production of capital goods and construction materials fell in 1932 to 40% of its 1927 level and 55% of its 1929 level, according to the National Bureau of Economic Research. Here was where the depression was focussed. These industries, by and large, exist only to build and install capacity for producing consumers' goods. Meanwhile, existing capacity to produce consumers' goods was ample to continue supplying them at the 1929 rate.

When demand for consumers' goods shrinks even moderately, even maintenance work can be postponed, and actual new capacity will be required only in exceptional industries. Under these conditions capital goods demand may go almost to zero. An extreme example is railroad locomotives. Only two were ordered in 1933 compared to 1,044 in 1929 and 2,604 in 1922.

Table 3 includes production records for a number of capital goods industries. The volume contraction in 1932 was double or triple the contraction in consumers' goods.

The situation of these industries is generally so desperate at depression lows, as to entitle them to separate consideration. Hence, the Durable Goods Problem: How can the violent swings in production be smoothed out? How can these industries be quickly reactivated in a depression?

The funds for purchasing capital goods and construction materials for maintenance and additional capacity came mainly from

- (1) Current profits of corporations not disbursed as dividends
- (2) Cash balances of corporations (Over and above working capital requirements)
- (5) Savings of individuals invested in new corporate securities and mortgages through insurance companies, savings banks, and the investment market.

Data on corporation profits are given in Table 4. The cash position of large corporations in 1932 (Table 32 and 33) was substantially as good as in 1923 and 1929. Not a few companies have recently been able to expand out of accumulated cash reserves and current profits, without recourse to the capital markets. Public flotation of new capital issues (including refunding) have shown little recovery so far (spring of 1936).

Note of classification: Assignment of products to one class or another is on the basis of its predominant use. Thus, some bituminous coal is used for house-heating by consumers, but as most is used by railroads, factories and power houses, it is classified as a producers' non-durable good. Some goods which receive further processing, as cotton textiles and newsprint, are raw materials from standpoint of some producers, but are classified in the same class as the product they will ultimately become. Thus, since cotton dresses and domestic "linens" are consumers' goods, cotton textiles are so classified.

## EMPLOYMENT

"It is hereby declared to be the policy of Congress . . . to reduce and relieve unemployment".

Unemployment is the evil of the depression which calls most urgently for solution. It outweighs all other features of the situation.

Unemployment is the human side of the unused physical capacity figure, unused human resource, idle hands and idle brains. It is a loss to the nation as well as to the individual unemployed. The man-hours that have gone to waste during the depression could have duplicated the entire railroad system not once, but twice or more.

Table 5 shows unemployment in the United States and foreign countries. The foreign countries' data are for manufacturing and other mechanical industries. Their representativeness ranges from very good for the United Kingdom down to poor for Poland and Japan. Unemployment in the United States for the twelve months ending April, 1933, was about 35% among all non-agricultural workers, and almost 50% among employees in manufacturing, transportation and construction. Unemployment figures in no other country were as high as this.

Chart 7 shows the magnitude of the problem. At the bottom of the depression there were about 50 million employables, (not including wives and other individuals not normally working for wages or salaries, but forced into the labor market for the time being), of which roughly 35 million were either employed by others or self-employed, and 15 million out of work. The number employed rose rapidly in 1933, then levelled off and even dipped once or twice. It has since been advancing again, but there still remains a large number to reabsorb.

Chart 8 shows indexes of employment in manufacturing, agriculture and railroads. The agricultural employment includes hired labor only. Relative to pre-depression levels railroads have given least employment during the depression, agriculture most, and factories an intermediate amount. Factory employment has now recovered about half way, and now gives at least as good a showing as agriculture, and possibly better. Agricultural labor (as reported) and railroad employment have not recovered very much as yet, both still being near the levels of 1932-33.

Where is the unemployment? Some industries may actually have employed more in 1932 than in 1929; gold mining and electrical refrigerators, for instance. At the other extreme there were probably some which employed less than one-tenth of their 1929 labor force. Most of the unemployment was and is in the capital goods and allied industries.

Table 7 shows employment and man-hours in a number of manufacturing industries, and residential building. The six highest ranking are non-durable goods industries; the six lowest ranking, durable goods industries.

Rayon and residential building represent the two extremes, the one, even in January - April, 1933, employing almost as many as in 1929, the

## B. THE PROBLEM OF ADJUSTMENT TO CHANGE

Two types of change were brought to the attention of H.R.A. These were, the displacement of labor by labor-saving devices, and industrial migrations from one region to another. Some very broad measures of change are provided in Table 9, taken from "The Gross National Product and its Components", by Clark Warburton, Journal of the American Statistical Association, December, 1934.<sup>1/</sup> The amount of consumers' expenditures, relative as well as absolute, flowing into each of the broad classes of goods and services shows pronounced shifts during the ten year period 1919 - 1929. Food, attire and social organizations grew scarcely at all, while shelter, transportation, education, recreation and stimulants increased markedly, especially the last two.

### TECHNOLOGICAL DISPLACEMENT OF LABOR

To the unemployment due to decline in production is added the unemployment due to elimination of workers by labor-saving machinery from some industries faster than they can acquire new skills and be absorbed by other industries. Chart 9 brings out clearly a striking contrast between the relation of factory production and employment before and after 1920.

Before 1920, manufacturing production and employment moved up together fairly well, after 1920 they pulled apart.

Chart 10 presents some factors in manufacturing. Production (Federal Reserve Board Index), employment and payrolls (Bureau of Labor Statistics) are shown, and an index of average hourly wages, as estimated by the (National Industrial Conference Board. Dividing the index of payrolls by the index of hourly earnings gives a rough estimate of man-hours. Dividing production by man-hours gives an output per man-hour, the topmost line on the chart, rising rapidly throughout the period. The labor cost per unit of output may be approximated by dividing payrolls by production. Although this procedure, on account of unavoidable imperfections in the basic data, may not be right in detail, it reveals highly interesting trends.

Output per man-hour showed a rapid advance during the twenties, and labor cost per unit a rapid decline. The period showed a net loss in employment, apparently workers eliminated from one manufacturing industry by technological improvements were not all reabsorbed by other manufacturing industries. At the three principal peaks of manufacturing activity in 1920, 1923 and 1929 there were progressively fewer at work in factories.

---

<sup>1/</sup> These amounts are considerably larger than the national income figures issued by the Department of Commerce, being prepared on a different basis, and including certain items not included in the Department's compilation, such as "imputed income."

\* Figure for 1929 from Maurice Leven, *America's Capacity to Consume*, p. 206. Estimates for other years based on the King-Leven estimates of national income and on capital gains as reported in *Statistics of Income*.

† Includes corporate surplus, income of endowed institutions, and governmental revenue drawn from business enterprises but used in providing services to persons or for capital purposes.

‡ Includes depreciation and depletion allowances, and crude allowances for bad debts in retail accounts and for goods and services furnished free to employees and customers but not included in individual incomes.

§ Payments to policyholders by insurance companies.

¶ Change in outstanding volume of means of payment.

Manufacturing Employment and Production

	Average Number Employed (000's)	FRB Index of Manufacturing Production
1919	9,041	84
1929	9,145 - E	87
1925	8,788	101
1929	8,839	119

except for a slight pick-up in 1929.

The National Bureau of Economic Research presents in Economic Bulletin 58 the following estimates of output per wage earner and per man hours during 1929 - 1934.

OUTPUT PER WAGE EARNER AND PER MAN HOUR IN MANUFACTURING  
ESTIMATES\* OF CHANGES, 1929 - 1934.

(1)

Year	Physical Output of Manufacture	Average No. of wage earners	Average Hours Worked.	Man Hours (3) x (4)	Output Per Wage Earner (2) ÷ (3)	Output Per Hour Man (2) ÷ (5)
1929	100	100	100	100	100	100
1930	84	87	93	31	97	104
1931	72	74	87	34	97	112
1932	57	62	77	48	91	118
1933	65	69	76	53	94	123
1934	59	73	70	55	88	125

In the light of apparent trends in the above factors how far would a recovery in production have to go to restore manufacturing employment to the pre-depression level?

Associated with this movement away from manufacturing was a movement into the so-called service occupations; real estate, finance, retail trade, the professions, other "white collar" occupations, and domestic and personal services. See Table 6. It should be added that "gainfully occupied" in Census usage does not mean "at work", but includes "all persons 10 years old and over who usually follow a gainful occupation, even though they may not have been employed when the census was taken." It is estimated that over 4,000,000 of the 48,850,000 gainfully occupied as of April, 1930, were out of work. How many of the several million additions to those gainfully occupied in the above service occupations were firmly absorbed and

---

\* These figures, which must not be accepted as precise measurements, apply only to activity in manufacturing industries as a whole.

established therein? And in how many cases not?

The very large number engaged in personal service occupations directly dependent on consumer purchasing power, should warn one against overemphasizing the durable goods problem. Production of consumers goods and services in 1929 was more than four times the production of capital goods, in terms of value.

## REGIONAL SHIFTS

Industrial migration imposes obvious problems on the region from which the industry is migrating - loss of employment to the residents, loss of taxes to the community, total or almost total paralysis of the capital goods industry in the evacuated regions. Quite apart from ultimate longtime benefits, to the country as a whole, the question arises whether these shifts do or do not impose strains on the economy which represent a net loss for a short time, at any rate.

One such shift, which has been widely observed, is the movement to the suburbs for residence purposes made possible by the automobile and express highways. Values in the partially abandoned urban areas were affected, and in turn mortgages and bank deposits backed by mortgages.

Two important industrial migrations are the migration of the Cotton Textile Industry from New England to the South, and the migration of the Boot and Shoe Industry from New England to the Atlantic and Middle Western States. Tables 10-20 present certain data regarding these industries. Table 9a shows value of product, payroll and mill balance cotton single hours in the Northeastern and Southeastern states in 1919 and 1935. Between 20 and 25% of the value, payrolls and mills balance was involved in the shift.

Table 10 shows shoe production in Massachusetts, once the main center of the shoe industry. In 1899 Massachusetts produced 47 per cent of all shoes produced in the United States. This percentage fell steadily to 35 per cent in 1919 and continued to fall thereafter until 20 per cent was reached in 1934.

Several causes have been adduced to explain these migrations. There are possibly savings in transportation charges from locating nearer the sources of raw materials and/or markets. Rents and taxes may be lower in the new locations. Labor costs per unit of outputs may differ. Some data on regional differences in hourly wage rates are presented, to which the reader is referred. It should be noted that these hourly wage rates are not necessarily good measures of labor cost. Advantages of certain regions in this respect may be more apparent than real. Low efficiency may more than offset low hourly wage rates and result in labor cost even higher than in high wage regions.

TABLE 14

BOOT AND SHOE INDUSTRY

Average Hourly Earnings by States, 1934, 1932, 1930

	M a l e			F e m a l e		
	1934 <sup>a</sup>	1932 <sup>b</sup>	1930 <sup>b</sup>	1934 <sup>a</sup>	1932 <sup>b</sup>	1930 <sup>b</sup>
Massachusetts	57.5¢	55.7	67.1¢	42.4¢	35.4¢	44.6¢
New Hampshire	58.7	43.9	50.5	45.0	29.1	34.9
Maine	49.7	44.7	51.1	33.9	29.9	36.0
New York	61.4	53.6	66.6	44.9	34.0	41.1
Ohio	54.2	48.5	59.0	39.3	29.2	36.1
Pennsylvania	47.4	40.8	51.2	35.9	24.8	33.1
Wisconsin	56.5	48.1	60.2	41.0	35.6	40.9
Missouri	52.2	47.3	54.8	37.7	27.3	32.1
Illinois	50.5	42.7	62.4	37.4	27.2	37.6

The spread between the high and low States was less in 1934 than in 1930:

	M a l e			F e m a l e		
	Low	High	Range	Low	High	Range
1934	47.4¢	61.4¢	14.0¢	35.9¢	45.0¢	9.1¢
1932	40.8	55.7	14.9	24.8	35.4	10.6
1930	50.5	67.1	16.6	32.1	44.6	12.5

There has also been a narrowing of the differential hourly earnings as between male and female:

	Lowest State for Males Exceeds Lowest for Females by	Highest State for Males Exceeds Highest For Females by
1934	11.5¢ hr	16.4¢ hr.
1932	16.0	20.3
1930	18.4	22.5

# CHART 13

## ACTUAL HOURLY EARNINGS--BOOT AND SHOE INDUSTRY

South--Male and Female Employees. Percentage Distribution by Hourly Earnings.

The height of each column shows the percentage of employees whose earnings fall in the interval represented by the base of the column. Percentages are based on reports to the Bureau of Census covering 5125 male and 4285 female employees for a week in March, 1934.

# CHART 14

## ACTUAL HOURLY EARNINGS - BOOT AND SHOE INDUSTRY

North--Male Employees. Percentage Distribution by Hourly Earnings in Cities of Large, Medium and Small Sizes.

The height of each column shows the percentage of employees whose earnings fall in the interval represented by the base of the column. Percentages are based on reports to the Bureau of Census covering 96,078 male employees for a week in March, 1934.

Actual Earnings in Cents per Hour.

# CHART 15

## ACTUAL HOURLY EARNINGS—BOOT AND SHOE INDUSTRY

North—Female Employees. Percentage Distributions by Hourly Earnings in Cities of Large, Medium and Small Sizes.

The height of each column shows the percentage of employees whose earnings fall in the interval represented by the base of the column. Percentages are based on reports to the Bureau of Census covering 78,672 female employees for a week in March, 1934.

Actual Earnings in Cents per Hour.

### C. THE PROBLEM OF OUT- OF- BALANCE PRICES

Whatever the explanation, it is a fact that some prices dropped precipitously during the depression, while others receded but little from the 1929 levels. Chart 16 shows indexes for ten groups of commodities, flexible, intermediate and rigid. The basis of classification is the number of month-to-month changes out of 94 opportunities for change during January, 1936, through November, 1933.

Group I includes those commodities which remained unchanged, Group II, those which changed 1 to 4 times, and so on, to Group X, which includes those commodities changing price at least once a month. (Source: Industrial Prices and their Relative Inflexibility, Senate Document No. 13, 74th Congress)

One qualification is necessary. Particularly in the "rigid" groups the basic data are sometimes nominal or price list quotations, and the actual net price to purchasers after discounts, terms and allowances, may be fairly flexible. Nevertheless, in its main outlines, the picture is substantially correct.

Chart 17 shows per cent deviations of price indexes principal of commodity, groups from the all-commodity index. As the statistician would say, each has been "deflated" by the wholesale price index. Metals and metal products, chemicals and drugs, and building materials, dropped less than the average during the depression, and accordingly their "deflated" indexes measure above 100. Textiles and their products, farm prices, and food products fell much faster and farther than the average, and so their "deflated" indexes go well below 100.

Chart 18 shows the ratio of flexible prices to rigid prices. The Federal Reserve Board Index of Production is included for comparison.

Many economists have said that lack of balance, maladjustment between groups of prices, was a contributing, or at least an aggravating cause of the depression. Some assert that prices of flexible - priced goods (chiefly farm products) must be brought up into line with other prices if goods were to interchange in volume. Others claim that price reductions, particularly for manufactured products, would bring these goods within reach of an ever-widening circle of consumers. An expansion of volume would follow, which would increase work opportunities.

Still others say that price cutting starts a vicious circle of wage cutting, lessened purchasing power, lessened volume decreased employment, and finally around to more price cutting. Demoralized prices, they say, sap the power of an industry to carry a reemployment load.

What constitutes a healthy, in-balance price structure? When are prices in adjustment? Where should individual prices go in order to unblock the flow of trade? If pre-depression relationships represent adjustment, then the last thirty months have witnessed a restoration of balance. Deflated price indexes for important groups, notably metals and metal products, and farm products, have returned towards the zero line. Raw materials, after getting 20% "out of line" with respect to the all-commodity index, are now only 3 or 4% "out of line."

Some would deny that the above constitutes a good measure of price adjustment. Many changes in costs, quality, demand and supply have taken place in the last six years which may call for new price relationships. The relation of price to costs may be a better measure of adjustment than the relation to an average of all prices.

A classification of code provisions dealing with prices will be found in "Content of N.R.A. Administrative Legislation, Part C."

The building industry has often been singled out as one in which prices are allegedly out of line, to such an extent, so it is said, as to be a serious bar to recovery. Chart 21 shows some statistical series related to building, and charts 22-43 the course of prices of important building materials from 1919 to 1934.

PRICES OF VARIOUS PRODUCTS AND SERVICES IN 1929, AND IN FEB. 1933 a/

for Sept. 29, 1934. (2) Monthly Labor Review, Aug. 1934, p. 510.

a/Accurate measurement of price changes of articles which change markedly in quality is difficult if not impossible. Adjustment of these figures for quality variations would show larger price decreases.

D. ECONOMIC BEHAVIOR

Preceding sections have presented price, production and employment data separately. But they are interrelated in fact, and one cannot be changed without affecting the others, and there are many other factors beside these. How these factors work together to encourage expansion of an industry or compel contraction, how the industry reacts to them, may be called the economic behavior of that industry, or its operative characteristics.

Remedial measures which take cognizance of these operating characteristics should have a better chance of obtaining their objectives.

An industry is an instrument through which goods and services are supplied. In the last analysis, its purpose is to provide products of one sort or another for consumers. But under the capitalist system this purpose is attained as a by-product of the quest for profit, and is rarely envisaged as an end in itself. Each business decision, whether to expand production or contract it, to follow an erratic seasonal pattern in production or regularize it, to lower prices or raise them, to advertise, to improve quality, to introduce new products, or abandon old, to employ a large research staff, to install new machinery, to build a new plant, is made for the purpose of increasing profits or cutting deficits.

No industry is static. There are vast numbers of economic relationships with outside factors and among internal elements which are continually in a state of change. Profit opportunities are always changing. New products force out old, foreign nations put up tariffs, there is a deflation of the general price level, bank credit expands or contracts, there is general prosperity or depression, and so on. Pressure on the profit motive forces the industry to bow to the new trend. The usual conception of the dynamics of adjustment is that it occurs through the market place where any change reflects itself on price, under the spur of competition. But the extent of truth in this hypothesis is a matter for inquiry in each case. How does this particular industry adjust itself? In some industries certain factors are extremely inflexible and the burden of any necessary adjustment must be taken up elsewhere.

The significance and strength of various external and internal elements vary tremendously. There are areas of flexibility and others of inflexibility which accept or shift the burdens imposed by the processes of change. An economic analysis must regard an industry as a living organism and analyze (1) the external and internal sources of disturbance, (2) the processes whereby the industry makes its adjustments to these factors and (3) the effects of the procedure upon the many interested parties.

The following charts present for some important industries a few of the factors whose interrelations require study. Employment, payrolls, prices and production are shown for agriculture manufacturing and railroads. Price and production charts are given for bituminous coal, cement, cigarettes, cotton, cotton goods, newsprint, plate glass, sulfuric acid, and zinc.

## E. THE PROBLEM OF PURCHASING POWER

Congress declared as a policy "to increase the consumption of industrial and agricultural products - by increasing purchasing power." An increase in purchasing power is a pre-requisite for recovery. What makes demand is desire plus money; demand equals want plus purchasing power.

Purchasing power is not a phrase of one meaning. A widely accepted meaning makes it equivalent to the current cash incomes of consumers - what they receive currently in the form of wages, salaries, dividends and interest, and entrepreneurial profits, farm income being the largest single constituent of the last. A better definition would be, the power to buy consumers' goods and services. This varies directly as the income, and inversely as the price, both being of equal importance. Purchasing power in this sense can be taken away by a price rise as surely and as unavoidably as by a drop in income.

The best measure of the purchasing power of a group is therefore, the ratio of the dollar amount of its income in the form of wages, et cetera, during an interval, to the level of prices of the goods it normally purchases. According to this definition, purchasing power can be created by a fall in the cost of living, even though the dollar income remains unchanged, and purchasing power can be destroyed by a sharp inflationary rise in the cost of living.

The principal means selected by the NRA for increasing purchasing power of the laboring class were, the setting of minimum rates of pay, equitable adjustment of rates above the minimum, and decreased hours of work. It was recognized that raising wages would raise costs, but manufacturers were asked to delay price increases as long as possible, and then to increase them only by the amounts necessary to recoup the wage rise. The problem of the NRA was, to establish those minimum and above-the-minimum wage rates, which would bring about, or allow, the greatest increase in the total dollar volume of wage payments relative to the cost of living.

The most authoritative estimates of the cash incomes of the 40 to 50 million income recipients are those of the Bureau of Foreign and Domestic Commerce. These show a total of \$78.6 billion in 1929, shrinking to \$48.4 billion in 1932 and \$44.9 billion in 1933. Total labor income went down from \$51.5 billion to \$30.9 and \$29.4 billion in the same years. Percentagewise, this is about the same shrinkage as the total; both showed a 43% decline in 1933 compared to 1929. Total labor income held up as well as it did because of salaries of government employees. But wages in manufacturing, mining, construction and steam railroads, et cetera, the hard-hit areas, declined 58%.

Recovery in income paid out to individuals started to recover in the second quarter of 1933, but the starting point was so low that even with continued recovery the 1933 total did not equal 1932 (see tables). However, 1934 exceeded 1933 by a wide margin.

It is interesting to note that total labor income in 1934 was a larger proportion of the total than previously, and that wages in mining, manufacturing, et cetera were a materially larger fraction of the total than in 1932.

The tables also show total income paid out by each major industrial group.

The month-by-month course of wage payments in manufacturing, railroads and farming is shown in chart 56. All three fell about equally from 1929 to 1932. From the low point, factory payrolls have recovered more than half their loss, while farm and railroad payments have advanced scarcely at all.

#### Annual Incomes

What are the annual incomes of workers? These have been estimated on a rough basis for seventeen important industries, by multiplying average weekly wages as reported by the Bureau of Labor Statistics by 40 and 50. (See Table 25.) Thus in the automobile and automotive parts industry weekly wages in 1934 and 1935 were \$22.97 and \$26.56 respectively. On the basis of 40 weeks' work per year these figures indicate annual incomes of \$919 and \$1062 respectively, and on the basis of 50 weeks per year, \$1143 and \$1328 respectively.

In 1935, assuming 40 weeks' work on the average, annual incomes ranged from \$513 for cotton textiles to \$1205 for printing and publishing.

These, of course, are averages. Many employees receive substantially less. Thus in cotton textiles, South, August 1934, 22.9% of the males and 37% of the females received \$8 or less. This was on a 30-hour week basis, during a curtailment. The code minimum was \$10 a week, which amounts to \$400 a year if the mills provide 40 full weeks of work.

#### COST OF LIVING

The other, and just as important element of purchasing power is the cost of living. The Index of the National Industrial Conference Board shown in Table 24 is the best one available on a monthly basis. In terms of 1929 equals 100 this fell to 69.0 in May, 1933, and has since risen to 79.0 in October, 1935.

DISTRIBUTION OF INCOME

The summary of findings of "America's Capacity to Consume," by The Brookings Institution, in reference to distribution of income in 1929 are reported as follows:

"Nearly six million families, or more than twenty one per cent of the total, had incomes less than \$1,000.

"About twelve million families, or more than forty two per cent, had incomes less than \$1500.

"Nearly twenty million families, or seventy one per cent, had incomes less than \$2500.

"Only a little more than two million families, or eight per cent, had incomes in excess of \$5,000.

"About 600,000 families, or twenty three per cent, had incomes in excess of \$10,000" (Source, America's Capacity to Produce and America's Capacity to Consume, a digest, the Falk Foundation of Pittsburgh, Pa., p. 41).

F. THE PROBLEM OF INDUSTRIAL CONCENTRATION  
AND THE SMALL FIRMS PROBLEM

The National Recovery Administration, in its operations in an economy in which the large corporation has become the dominant form of economic enterprise, and at the close of a period in which the trend to large organizations had gone on at an accelerated pace. It was especially directed by Congress not to permit codes "designed to promote monopolies or to eliminate or oppress small enterprises."

Statistics on small firms are difficult to procure for the very reason that, being small, their fortunes go unrecorded. It is, however, possible to study large firms, and infer what happened to the small. The size range in business enterprises is very large.

Statistics of Income for 1931 and 1932 published distributions of corporations by size of assets, of which the following is an abstract.

ALL GENERAL INDUSTRIAL  
CORPORATIONS FILING BALANCE SHEETS      CORPORATIONS REPORTING TOTAL  
ASSETS OF \$50,000,000 OR MORE EACH

	Number	Total Assets (Millions)	Number	Percent of Total Number	Total Assets (millions)	Percent of Total Assets
1931	256,789	\$104,117	300	.078	\$38,333	37.2
1932	270,353	97,110	171	.063	35,215	36.3

Qualifications necessary to mention are, (1) that the above takes no account of unconsolidated assets of subsidiary or controlled affiliated companies, where these have assets less than \$50,000,000; (2) that not all corporations file balance sheets; but those that do not are in general small companies, so that the total asset comparison would not be changed appreciably were all balance sheets available.

The ten largest general industrial corporations in terms of number of employees were (1929)

TEN LARGEST INDUSTRIAL CORPORATIONS  
IN TERMS OF EMPLOYEES EMPLOYED IN 1929

<u>Company</u>	<u>Number employed in 1929</u>	<u>Approximate Number of states in which estab- lishments are operated</u>
General Motors	231,286	14
United States Steel	224,960	12
Ford	over 100,000*	
General Electric	87,963	10
Bethlehem Steel	64,316	9

<u>Company</u>	<u>Number employed in 1929</u>	<u>Approximate Number of states in which estab- lishments are operated</u>
Armour	60,000	24
Swift	58,000	16
Standard Oil of New Jersey	44,700	14
International Harvester	40,000	8
Goodyear	<u>39,755</u>	6
Total	over 952,950

 (Standard Statistics Co.).

The large corporation is a comparatively recent phenomenon. The following table shows the largest manufacturing firms as of various dates from 1800 to 1929:

INCREASE IN SIZE OF CONCERN

<u>Date</u>	<u>Industry or companies</u>	<u>Size (number of employees)</u>	<u>Remarks</u>
1800	Household industries <sub>a</sub> /	"Household"	Often part-time employment of farmers.
1810	Iron furnaces <sub>b</sub> /	20 (?)	Highest plausible average figure. Estimated.
1810	Bloomeries <sub>b</sub> /	2 or 3	Average, estimated.
1811	Wool factories <sub>c</sub> /	150	"Largest".
1815	Merino wool factories <sub>d</sub> /	50	"One of the largest of this class."
1839-			
1860	Brady's Bend Iron Company <sub>e</sub> /	538 laboring families	"Among the largest in America before the Civil War".

<u>Date</u>	<u>Industry or companies</u>	<u>Size (number of employees)</u>	<u>Remarks</u>
1929f/	United States Steel Corp.	824,930)	The two largest manufacturing corporations.
1929f/	General Motors Corp.	858,533)

Corporations have grown in size mostly by reinvestment of earnings, but also by mergers and acquisitions, particularly since the World War. The following data on mergers are taken from Recent Economic Changes, I, 186.

MERGERS AND ACQUISITIONS IN MANUFACTURING AND MINING

1919 - 1928

	<u>Mergers Recorded</u>	<u>Concerns Acquired</u>	<u>Concerns Acquired</u>	<u>Net Concerns Disappearing</u>
1919	39	222	235	433
1920	173	474	459	760
1921	39	373	203	437
1922	67	220	156	309
1923	67	218	160	311
1924	95	265	200	363
1925	121	327	342	554
1926	139	597	398	856
1927	207	673	399	879
1928	221	637	572	1038

Profits of the large corporations have apparently grown more rapidly than the earnings of small corporations. Table 29 presents profits of general industrial corporations from Statistics of Income, comprising the following groups:

- Agriculture
- Mining
- Manufacturing
- Construction
- Trade
- Service
- Miscellaneous

The next column shows the net income of 657 industrial corporations, to which is added changes in net worth of the Ford Motor Company (the only available indication of its profits) in the third column. This gives

approximately, profits of 658 large companies (column 4), which may be compared with the profits of the approximately 300,000 general industrial corporation. These 658 companies earned 41.4% of the profits of the entire group in 1925 and 47.7% in 1929 - almost as much as all the others put together.

A similar comparison is worked out using profits of 165 industrial corporations compiled by the Federal Reserve Bank of New York, to which the changes in net worth of the Ford Motor Company have been added. This group had 17% of the profits of all general industrial corporations in 1925 and 27% in 1929.

Although the above trends are very clear-cut, the ratios may not be quite correct, because the 658 corporations may represent certain industrial groups more heavily than others, and because tax returns may not be identical with published income statements.

The same trend is shown by comparison of asset items. Table 52 presents a comparison of the total assets of 418 industrial corporations with total assets of all general industrial corporations filing balance sheets with the Bureau of Internal Revenue. It also shows data on the cash assets and working capital of these 418 industrial corporations compared with those of all general industrial corporations.

As mentioned before, direct statistics on small firms are very few; and those that are available do not appear to throw any light on E.R.A. problems.

What is a small firm? Is the number of employees a satisfactory index? Two hundred employees would represent a very small rayon establishment, where the average establishment employed 1,348 in 1929. But in the paint and varnish industry over 40% of the establishments had five employees or less, and there were no establishments with over 100 employees. Table 54 gives some idea of the extreme variations existing, and the difficulty of drawing a dividing line between small and large.

Classification of commercial failures by size of liability proved useless. The published figures include only those where petitions in bankruptcy were filed and do not even hint at the multitude of small firms that were liquidated without loss to creditors in the holocaust of 1930-31-32, or where creditors failed to institute legal proceedings; and in any event the size of liability to creditors may be a poor measure of size.

Are higher wages a burden on small firms because they normally pay lower rates than large? Table 35 presents 1935 data for a number of industries in which the smaller firms paid out in wages a smaller proportion of value added by manufacture than the large, and Table 37 presents data for other industries in which the reverse was true. Table 38 shows average monthly wages in 1933 for some industries in which the smaller paid higher average wages than the larger, and Table 39 gives average monthly wages for some industries where the reverse was true.

1933 Census of Manufactures.

## II. THE WORK-SHARING OBJECTIVE

Pending recovery in production, considerable reemployment could take place by employing "... more men to the existing work by reducing the work of each man's week."

Table 40 presents an estimate, based on certain assumptions, of the reemployment effected by work-sharing. Column 4 of the table presents an estimate of man-hours in manufacturing. There were some 398 million used per week in 1929, and 130 million per week in March, 1933. From mid-1933 to September, 1935, the number used averaged about 236 million, ranging from 207 to 262 million. Just before the N.R.A. went into effect, industry operated on a 42.5 hour week. If this work week had continued, and if the number of man-hours had been as in the fourth column, then the fifth column shows the number of men that would have been employed. This shows very little recovery. Not until 1935 does the number advance much above the panic levels of early 1933 and hold the gain. In September, 1935, with a demand for 262 million man-hours, a 42.5 hour average week would have employed only 6,164,000 compared with 7,004,000 actually at work. The difference, 840,000, represents the number at work who might have been unemployed were it not for work-sharing. The hypothetical reemployment due to the work-sharing program ranges up to 1,360,000.

This calculation is suggestive and arresting, but it cannot be stranger than the basis on which it was made, viz, that other factors would have been as they were. But no one knows whether they would or not. Would production have been greater or less, and demand for the services of labor have been greater or less without the work-sharing program? If greater, would it have been great enough to take up to a million off the lists of unemployed?

Although these remoter implications are not directly indicated by the statistics, the immediate fact remains that the work week was shortened substantially. Table 41 shows average hours worked per week in 17 important manufacturing industries. It will be noticed that in some industries hours dropped sharply in 1931 and 1932. These industries are chiefly durable goods industries, where volume fell unprecedentedly low and work-sharing was voluntarily adopted. The problem here was, not to have a cut in hours, but merely to avoid a return to the pre-depression work-week. In others, chiefly consumers' and non-durable goods industries, hours were not far below 1929 levels. Examples are boots and shoes, cotton textiles, hosiery, meat packing and paper and pulp. Hours in these industries dropped sharply when the codes were instituted in the summer and fall of 1933.

In general, industries do not succeed in operating at the code maximum. Thus the textile industries, which had a 40 hour maximum work week, rarely succeeded in averaging more than 36 hours' work for their employees. The averages are pulled down by individual firms and employees whose operations fall far short of the code maxima. The extent of this disparity in working times, with and without the codes is illustrated by frequency distributions of working time for the Lumber and Leather Industries (1932), Silk and Rayon (1933-34), and Woolen and Worsted (1932-33-34) Tables 42, 43, 44; also for the Cotton Textile Industry (1933-34) in the section on hourly wages. (Table 29)

CHART 57

EFFECT ON WORK WEEK DISTRIBUTION OF WELL ENFORCED CODE WHICH PROVIDES TIME AND ONE THIRD FOR HOURS OVER 40.

### III. THE OBJECTIVE OF STABILIZED OUTPUT.

Stable, steady operation of the nation's industrial plant, with a view to spreading employment more evenly throughout the year, was a secondary but nevertheless important objective of certain N.R.A. codes. The problem is threefold.

(1) Cyclical irregularity of production associated with corresponding irregularity in demand; the problem of capacity operation.

(2) Cyclical irregularity of production due to maledjustments of supply to demand over a period of a year or more; production in peak years in excess of demand, production in depression years below demand.

(3) Seasonal irregularity of production and employment. Seasonal stability generally to be attained by building up inventories in the season of lowest consumer demand, and depleting inventories in the season of peak consumer's demand, so far as practicable.

Some industries furnish very regular employment throughout the year; others are very erratic. A chart is presented showing typical seasonal movement of employment in various industries arranged in order from least stable to most stable. Among the irregular industries are women's clothing, cement, and automobiles; among the most regular are petroleum refining, baking, foundries, blast furnaces, and newspapers and periodicals.

Monthly employment indices for 1932-1935 are shown for automobiles and cement, and monthly production indices for boots and shoes, 1923 - 1924 and 1933 - 1934.

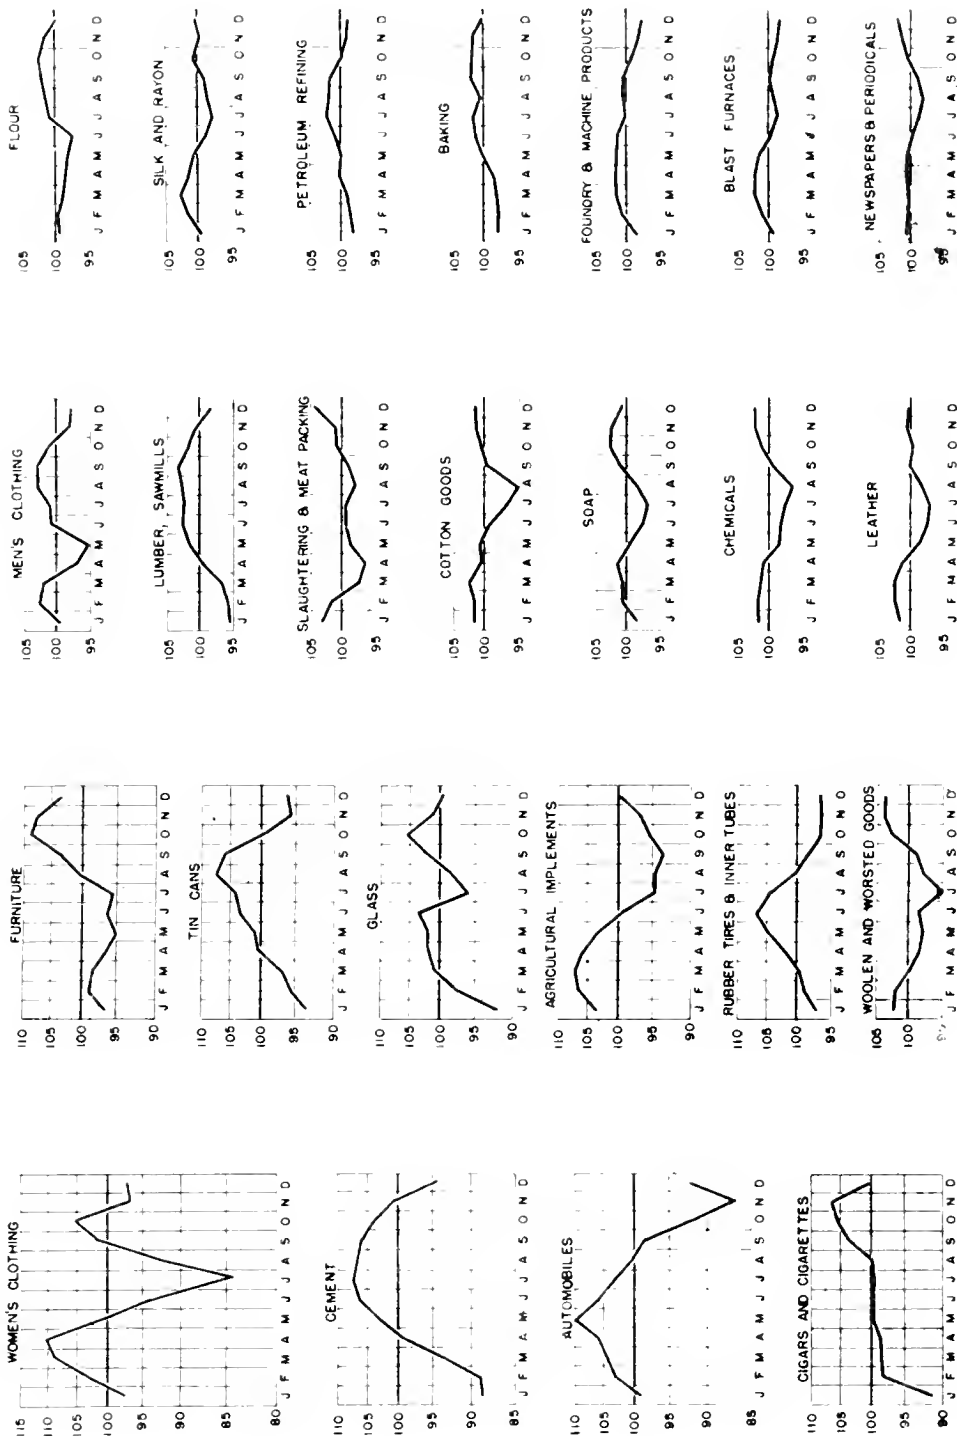

In 1935 - 1936 the automobile industry made a determined attempt to narrow the seasonal swings of the employment curve by moving forward the introduction of new models to November.

IV. THE OBJECTIVE OF FAIR COMPETITION.

What is fair competition? The trade practices of the codes show what some, at least, in each coded industry considered fair and unfair, as regards: production quotas, plant and machine hours, additional productive capacity inventory control, open prices and bid filing terms, and so forth.

A classification and summary of trade practice provisions will be found in Work Materials No. 35, "Content of NIRA, Administrative Legislation, Part C."

OFFICE OF THE NATIONAL RECOVERY ADMINISTRATION  
THE DIVISION OF REVIEW

THE WORK OF THE DIVISION OF REVIEW

Executive Order No. 7075, dated June 15, 1935, established the Division of Review of the National Recovery Administration. The pertinent part of the Executive Order reads thus:

The Division of Review shall assemble, analyze, and report upon the statistical information and records of experience of the operations of the various trades and industries heretofore subject to codes of fair competition, shall study the effects of such codes upon trade, industrial and labor conditions in general, and other related matters, shall make available for the protection and promotion of the public interest an adequate review of the effects of the Administration of Title I of the National Industrial Recovery Act, and the principles and policies put into effect thereunder, and shall otherwise aid the President in carrying out his functions under the said Title. I hereby appoint Leon C. Marshall, Director of the Division of Review.

The study sections set up in the Division of Review covered these areas: industry studies, foreign trade studies, labor studies, trade practice studies, statistical studies, legal studies, administration studies, miscellaneous studies, and the writing of code histories. The materials which were produced by these sections are indicated below.

Except for the Code Histories, all items mentioned below are scheduled to be in mimeographed form by April 1, 1936.

THE CODE HISTORIES

The Code Histories are documented accounts of the formation and administration of the codes. They contain the definition of the industry and the principal products thereof; the classes of members in the industry; the history of code formation including an account of the sponsoring organizations, the conferences, negotiations and hearings which were held, and the activities in connection with obtaining approval of the code; the history of the administration of the code, covering the organization and operation of the code authority, the difficulties encountered in administration, the extent of compliance or non-compliance, and the general success or lack of success of the code, and an analysis of the operation of code provisions dealing with wages, hours, trade practices, and other provisions. These and other matters are canvassed not only in terms of the materials to be found in the files, but also in terms of the experiences of the deputies and others concerned with code formation and administration.

The Code Histories, (including histories of certain NRA units or agencies) are not mimeographed. They are to be turned over to the Department of Commerce in typewritten form. All told, approximately eight hundred and fifty (850) histories will be completed. This number includes all of the approved codes and some of the unapproved codes. (In Work Materials No. 18, Contents of Code Histories, will be found the outline which governed the preparation of Code Histories.)

(In the case of all approved codes and also in the case of some codes not carried to final approval, there are in NRA files further materials on industries. Particularly worthy of mention are the Volumes I, II and III which constitute the material officially submitted to the President in support of the recommendation for approval of each code. These volumes 9768--1.

set forth the origination of the code, the sponsoring group, the evidence advanced to support the proposal, the report of the Division of Research and Planning on the industry, the recommendations of the various Advisory Boards, certain types of official correspondence, the transcript of the formal hearing, and other pertinent matter. There is also much official information relating to amendments, interpretations, exemptions, and other rulings. The materials mentioned in this paragraph were of course not a part of the work of the Division of Review.)

### THE WORK MATERIALS SERIES

In the work of the Division of Review a considerable number of studies and compilations of data (other than those noted below in the Evidence Studies Series and the Statistical Material Series) have been made. These are listed below, grouped according to the character of the material. (In Work Materials No. 17, Tentative Outlines and Summaries of Studies in Process, these materials are fully described).

#### Industry Studies

Automobile Industry, An Economic Survey of  
Bituminous Coal Industry under Free Competition and Code Regulation, Economic Survey of

9768--4.

THE EVIDENCE STUDIES SERIES

The Evidence Studies were originally undertaken to gather material for pending court cases. After the Schechter decision the project was continued in order to assemble data for use in connection with the studies of the Division of Review. The data are particularly concerned with the nature, size and operations of the industry; and with the relation of the industry to interstate commerce. The industries covered by the Evidence Studies account for more than one-half of the total number of workers under codes. The list of those studies follows:

Automobile Manufacturing Industry	Leather Industry
Automotive Parts and Equipment Industry	Lumber and Timber Products Industry
Baking Industry	Mason Contractors Industry
Boot and Shoe Manufacturing Industry	Men's Clothing Industry
Bottled Soft Drink Industry	Motion Picture Industry
Builders' Supplies Industry	Motor Vehicle Retailing Trade
Canning Industry	Needlework Industry of Puerto Rico
Chemical Manufacturing Industry	Painting and Paperhanging Industry
Cigar Manufacturing Industry	Photo Engraving Industry
Coat and Suit Industry	Plumbing Contracting Industry
Construction Industry	Retail Lumber Industry
Cotton Garment Industry	Retail Trade Industry
Dress Manufacturing Industry	Retail Tire and Battery Trade Industry
Electrical Contracting Industry	Rubber Manufacturing Industry
Electrical Manufacturing Industry	Rubber Tire Manufacturing Industry
Fabricated Metal Products Mfg. and Metal Fin- ishing and Metal Coating Industry	Shipbuilding Industry
Fishery Industry	Silk Textile Industry
Furniture Manufacturing Industry	Structural Clay Products Industry
General Contractors Industry	Throwing Industry
Graphic Arts Industry	Trucking Industry
Gray Iron Foundry Industry	Waste Materials Industry
Hosiery Industry	Wholesale and Retail Food Industry
Infant's and Children's Wear Industry	Wholesale Fresh Fruit and Vegetable Indus- try
Iron and Steel Industry	Wool Textile Industry

THE STATISTICAL MATERIALS SERIES

This series is supplementary to the Evidence Studies Series. The reports include data on establishments, firms, employment, payrolls, wages, hours, production capacities, shipments, sales, consumption, stocks, prices, material costs, failures, exports and imports. They also include notes on the principal qualifications that should be observed in using the data, the technical methods employed, and the applicability of the material to the study of the industries concerned. The following numbers appear in the series:  
9768—5.

Asphalt Shingle and Roofing Industry  
Business Furniture  
Candy Manufacturing Industry  
Carpet and Rug Industry  
Cement Industry  
Cleaning and Dyeing Trade  
Coffee Industry  
Copper and Brass Mill Products Industry  
Cotton Textile Industry  
Electrical Manufacturing Industry

Fertilizer Industry  
Funeral Supply Industry  
Glass Container Industry  
Ice Manufacturing Industry  
Knitted Outerwear Industry  
Paint, Varnish, and Lacquer, Mfg. Industry  
Plumbing Fixtures Industry  
Rayon and Synthetic Yarn Producing Industry  
Salt Producing Industry

#### THE COVERAGE

The original, and approved, plan of the Division of Review contemplated resources sufficient (a) to prepare some 1200 histories of codes and NRA units or agencies, (b) to consolidate and index the NRA files containing some 40,000,000 pieces, (c) to engage in extensive field work, (d) to secure much aid from established statistical agencies of government, (e) to assemble a considerable number of experts in various fields, (f) to conduct approximately 25% more studies than are listed above, and (g) to prepare a comprehensive summary report.

Because of reductions made in personnel and in use of outside experts, limitation of access to field work and research agencies, and lack of jurisdiction over files, the projected plan was necessarily curtailed. The most serious curtailments were the omission of the comprehensive summary report; the dropping of certain studies and the reduction in the coverage of other studies; and the abandonment of the consolidation and indexing of the files. Fortunately, there is reason to hope that the files may yet be cared for under other auspices.

Notwithstanding these limitations, if the files are ultimately consolidated and indexed the exploration of the NRA materials will have been sufficient to make them accessible and highly useful. They constitute the largest and richest single body of information concerning the problems and operations of industry ever assembled in any nation.

L. C. Marshall,  
Director, Division of Review.
